WebD: All the eye catching and beautiful websites that we all see and use in our daily lives are a product of Web Development. World Wide Web is a huge network of inter connected networks developed by Tim Berners Lee.

There are two types of websites, static and dynamic websites. A static website does not change its value. Once deployed, the website remains as it is and does not need to be changed again and again for example, a blog site. Languages: html, css, bootstrap.

Dynamic website requires to be changed again and again. For example, a weather site. It requires API and frame works like react, node.js, angular.
